

Clinical Workflow and Patient Safety

Typical outpatient flow: registration -> triage/vitals -> clinician encounter -> orders (labs/meds/imaging) -> checkout -> follow-up.

Inpatient flow: admission -> assessments -> care plan -> medication administration (eMAR) -> discharge summary -> referrals.

Patient safety: unique patient identifiers, barcode med admin, allergy checks, fall risk scoring, and sepsis early warning scores.

Documentation must be contemporaneous, attributable, and legible.
Audit trails must record who viewed or changed clinical data.
