

Electronic Health Record (EHR) Best Practices

EHR systems should support: patient demographics, problem lists, medication lists, allergies, vitals, clinical notes, lab results, imaging reports, care plans, and appointment scheduling.

Interoperability: use FHIR R4 resources (Patient, Encounter, Observation, MedicationRequest) for exchange. Prefer REST APIs with OAuth2.

Clinical decision support should alert on drug interactions and allergies without alert fatigue. Keep workflows clinician-friendly.

Availability target for clinical systems is typically 99.9%+.
Backup and disaster recovery must be tested regularly.
